

Responsibilities in IaaS, PaaS, and SaaS

IaaS (Infrastructure as a Service): AWS manages the physical infrastructure, but I am responsible for most of what runs on it, such as the operating system, applications, data, and security configurations. It's like renting an empty house. The landlord provides the building and basic utilities, but I'm responsible for setting up and managing most things inside.

PaaS (Platform as a Service): AWS manages the infrastructure and operating system or platform. I mainly focus on my application, data, and access/security settings. It's like renting a fully furnished house. The landlord takes care of the building and major systems, while I focus on how I use and manage the space.

SaaS (Software as a Service): AWS/the service provider manages almost everything, including the infrastructure, platform, and application. I mainly manage my data, users, access, and how I use the software securely. It's like staying in a hotel. The hotel manages the building, furniture, maintenance, and services. I mainly manage my personal belongings and how I use the room.

IaaS → I manage more.

PaaS → We share the responsibility.

SaaS → The provider manages more
